A computer institute offers programming, networking, cybersecurity and database courses. Students enroll in batches, faculty members conduct classes, practical laboratories are allocated, examinations are conducted and certificates are issued after course completion.

Managing these activities manually can result in data redundancy, inconsistency and difficulty in retrieving information.

A centralized database system is therefore required to organize and manage institute operations efficiently.

PROJECT INTRODUCTION

The Computer Institute Management System is a database-driven system designed to manage the academic and administrative activities of a computer training institute.

The system maintains information about students, courses, faculty, batches, laboratories, examinations, results and certificates.

It provides a structured and centralized approach to storing and retrieving institute data.

SYSTEM ARCHITECTURE

The system consists of 10 interconnected tables that manage students, courses, faculty, batches, enrollments, laboratories, examinations, results and certificates. Relationships between tables are established using primary keys and foreign keys.

SQL QUERIES
- CREATE
- INSERT
- SELECT
- UPDATE

MYSQL DATABASE
- 10 Tables
- Relational Data

TABLE RELATIONSHIPS
- Primary Keys
- Foreign Keys

OUTPUT
- Data Retrieval
- Reports / Results

DATABASE THEORY

Relational Database Management System (RDBMS)
Data is stored in related tables using Primary Keys and Foreign Keys.
Normalization helps reduce data redundancy and maintain data consistency.
SQL is used to create, retrieve, update and manage database information.

TOOLS USED

Language: SQL

Database: MySQL

Development: SQL Workbench
